Milestone 4 Narrative

This artifact is from a personal project I created while completing a certification. The artifact is a clothing store inventory database. I selected this item because I thought it had great potential for more complex enhancements. The initial artifact was very simple, only having one table and basic queries. To enhance the artifact for this milestone, I reorganized the database by breaking the original table into separate tables for categories, suppliers, products, and inventory. I connected the tables using primary and foreign keys and used joins to pull information together from each table. I also created views that make it easy to see low-stock products, inventory value, supplier inventory, and category inventory. I believe I met the course outcomes I planned to focus on in Module One. This enhancement helped me build a better understanding of relational databases, table relationships, joins, and views. I do not have any changes to my outcome-coverage plan because I feel my enhancements demonstrate the database skills I wanted to show. As I was making improvements, I learned that adding views to a database makes it easier to retrieve information rather than having to rewrite the same query each time. I also learned that organizing data into multiple tables rather than one large table makes querying more efficient. I did not face any major challenges during my modifications other than trying to remember syntax for joins and what tables I wanted to join. This challenge made me more comfortable writing joins as they have always been something I struggled with.
